

**MC14049UB**

**Hex Buffers**

The MC14049UB hex inverter/buffer is constructed with MOS P-channel and N-channel enhancement mode devices in a single monolithic structure. This complementary MOS device finds primary use where low power dissipation and/or high noise immunity is desired. This device provides logic-level conversion using only one supply voltage,  $V_{DD}$ . The input-signal high level ( $V_{IH}$ ) can exceed the  $V_{DD}$  supply voltage for logic-level conversions. Two TTL/DTL Loads can be driven when the device is used as CMOS-to-TTL/DTL converters ( $V_{DD} = 5.0\text{ V}$ ,  $V_{OL} \leq 0.4\text{ V}$ ,  $I_{OL} \geq 3.2\text{ mA}$ ). Note that pins 13 and 16 are not connected internally on this device; consequently connections to these terminals will not affect circuit operation.

- High Source and Sink Currents
- High-to-Low Level Converter
- Supply Voltage Range = 3.0 V to 18 V
- Meets JEDEC UB Specifications
- $V_{IN}$  can exceed  $V_{DD}$
- Improved ESD Protection on All Inputs

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields referenced to the  $V_{SS}$  pin, only. Extra precautions must be taken to avoid applications of any voltage higher than the maximum rated voltages to this high-impedance circuit. For proper operation, the ranges  $V_{SS} \leq V_{in} \leq 18V$  and  $V_{SS} \leq V_{out} \leq V_{DD}$  are recommended.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either  $V_{SS}$  or  $V_{DD}$ ). Unused outputs must be left open.
